

Canopy: know exactly when and where to water

Water the right spot, at the right time, every time

- Field-level soil moisture
- One dashboard for every block
- Alerts before stress shows

Guesswork costs water and yield

Calendar-based watering guesses in both directions

- Overwatering wastes water and power
- Underwatering shows up as yield loss weeks later
- Neither mistake is visible until it's too late to fix

What Canopy does

One live picture of every field

- Soil moisture sensors
- Weather-aware scheduling
- Works with existing irrigation hardware

How it works: sensors in the field

Sensors report from the ground, not just the sky

- Soil moisture
- Soil temperature
- Soil salinity

How it works: the data pipeline

- Sensor readings
- Weather feed
- Combined moisture forecast

The dashboard and alerts

See stress before it becomes damage

- Map view by field
- Amber-before-red warnings
- Phone alerts for the operations team

Automation: closing the loop with valve control

Automatic where you want it, manual where you don't

- Connects to existing valve controllers
- Threshold-based automatic watering
- Manual override always available

A fictional result: the Fernvale Orchards story

Fictional customer, fictional season, for illustration only

- Four blocks monitored
- One season of fictional data
- Used to demonstrate a results slide, not a real claim

What it costs
